INTEROFFICE MEMORANDUM

To: New Team Member

From: Team 02

Date: October 24, 2026

Subject: Perimeter Assessment

Summary: This document outlines how Nmap can be used to scan the external perimeter of our Network to identify open ports and publicly accessible services.

Nmap Use and Commands

Welcome to the team! We are excited to help you learn how to use Nmap to identify the services that are exposed on our network's external firewall. In order to scan the 'external perimeter of the firewall', we need to run an Nmap scan on all of our network devices.

Nmap stands for 'Network Map' and allows for a clear mapping of the open ports services running on network devices so that we can determine the current integrity of our network security. The following Nmap command will list services and ports open on

We would suggest running the following command to scan the external perimeter of all of our network devices that are essential for business continuity.

```
> nmap -Pn -sV -T4 172.25.22.10,15,20,100,120,200
```

Explanation of the command:

- The '-Pn' flag skips the process where it pings the host to see if it is up. This is important if you are getting errors saying the host is not up.
- The '-T4' flag increases the speed at which the Nmap is completed.
- The '-sV' flag also displays the version of the service that is open. This flag makes the Nmap scan take longer and is optional.
- The command likewise lists the private IP address for our network device. It specifically scans 172.25.22.10, 172.25.22.15, 172.25.22.20, 172.25.22.100, 172.25.22.120, 172.25.22.200

Alternatively, you can run the following command to use a text file which lists each network device's IP address on a separate line to scan all of them.

```
> nmap -iL 'file containing host names'
```

Example Results

Here is an example result from running the suggested nmap command and the result it returned for the Rocky Ecom device (172.25.22.10) from the Kali Linux device. Nmap outputs the results from the scan into your terminal.

```
> nmap -Pn -T4 172.25.22.10,15,20,100,120,200
```

```
Starting Nmap 7.99 ( https://nmap.org ) at 2026-10-24 09:50 -0500
Nmap scan report for 172.25.22.10
Host is up (0.00100s latency).
Not shown: 997 filtered tcp ports (no-response)
PORT    STATE SERVICE
22/tcp  open  ssh
80/tcp  open  http
443/tcp open  https
```

Nmap done: 6 IP addresses (5 hosts up) scanned in 12.03 seconds

We hope you found this guide to using Nmap on the Kali device helpful. Welcome to the team!

If there are any concerns, questions, or clarifications, please do not hesitate to reach out.

With Regards,
Team 07
